Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value

1.Brainstorming & Ideation Phase

1.Objective

To control access to ServiceNow records based on a specific field value using a scripted Access Control List (ACL). The objective is to ensure that users can access records only when the defined field condition is satisfied.

2.Activities

Create or open the required table in ServiceNow.

Create a Read ACL for the table.

Select the required field/value condition.

Add a script to validate the field value.

Save and test the ACL.

Verify access with valid and invalid field values.

Confirm that unauthorized records are restricted.

3. Expected output

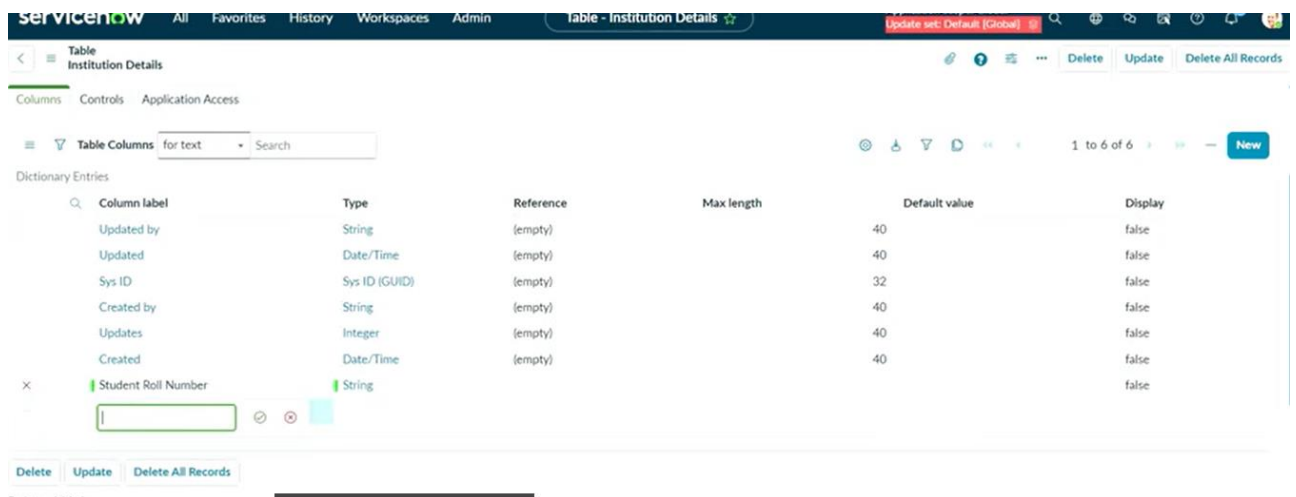

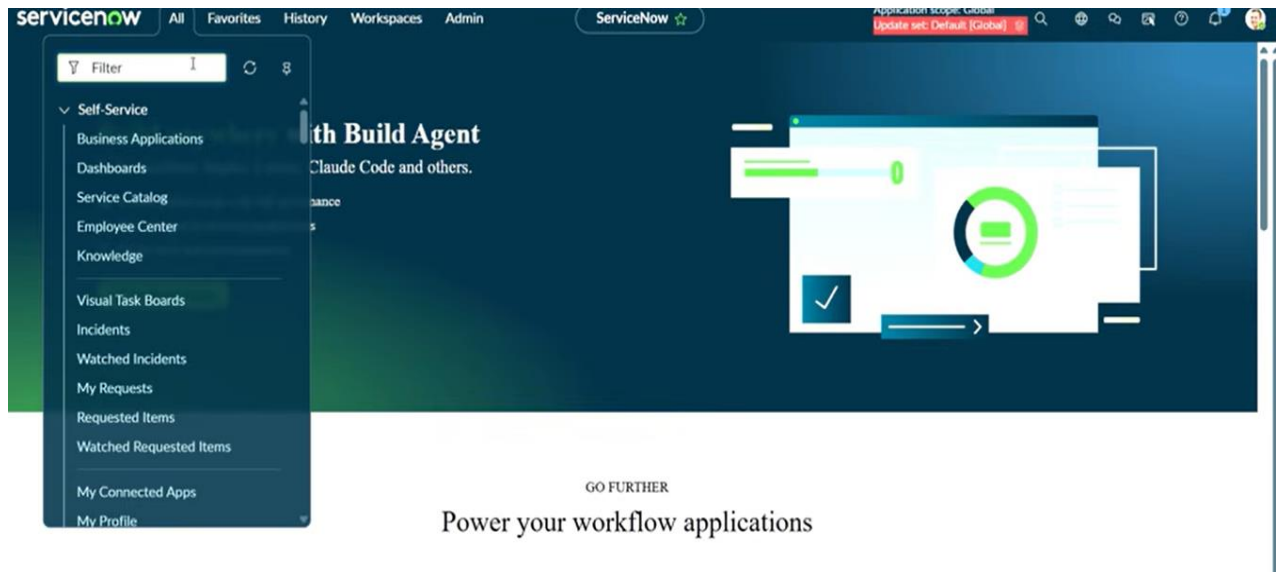

Users can access records when the field value satisfies the specified condition.

Records with an invalid or restricted field value cannot be accessed.

The ACL successfully controls record-level access using a script.

Unauthorized access is prevented.
