

Script-Controlled ACL – Restrict Record Access Based on Field Value

Objective

To control record access based on a specific field value using a scripted Access Control List (ACL) and ensure that only authorized users can access the records.

Activities Performed

- Identify the users or roles that should have access to the records.
- Define the field value that determines whether a user is allowed to access the record.
- Create an ACL rule to control access to the required record or table.
- Develop a script condition to validate the field value before granting access.
- Configure the ACL to allow access only when the specified condition is satisfied.
- Test the ACL with different users and field values to verify the access restrictions.

Expected / Produced Output

The script-controlled ACL successfully restricts record access based on the specified field value: Record Request → Field Value Validation → Script Execution → Access Granted/Denied → Secure Record Access.

Screenshots:

The screenshot shows the ServiceNow user interface for the 'Institution Details' form. The top navigation bar includes the ServiceNow logo, tabs for 'All', 'Favorites', and 'History', and a breadcrumb trail 'Institution Details - Create Created'. A search bar is located on the right. The main header area displays 'Institution Details' and 'New record'. The form contains several input fields: 'Student Id Number', 'Email', 'Phone Number', and 'Faculty Name'. A 'Submit' button is positioned at the bottom left. On the right side, a dropdown menu is open for the 'Branch' field, showing options like 'Configure Label', 'Configure Dictionary', 'Configure Styles', 'Show Security Rules', 'Configure Choices', 'Show Choice List', and 'Show - u_branch'. The 'Configure Label' option is currently selected and highlighted.
