

5. Project Development Phase

Objective

To implement the Script-Controlled ACL in ServiceNow to restrict record access based on a specific field value.

Activities Performed

- Open the ServiceNow platform and navigate to the required table for record access control.
- Create the required Access Control List (ACL) for the selected record or operation.
- Configure the ACL to control access based on the specified field value.
- Create the script condition to check the field value of the requested record.
- Configure the script to allow access when the defined condition is satisfied.
- Configure the script to restrict access when the field value does not meet the specified condition.
- Test the ACL with different field values and user access conditions.
- Verify that authorized users can access the permitted records.
- Verify that restricted users are prevented from accessing the records.
- Save, validate, and activate the ACL after completing the configuration.

Expected / Produced Output

A working ServiceNow Script-Controlled ACL that dynamically allows or restricts record access based on the specified field value.
